User stories:

Priority	User Story	MoSCoW	Story Points
1	As a traveller, I want to plan a route between two locations so that I can travel safely.	Must	5
2	As an admin, I want to change the indicator value of a segment to reflect recent changes in the environment.	Must	2-3
3	As a user, I want to access the application via a webpage for ease of use	Must	5
4	As a traveller I want to select routes to complete a mission to learn more about safe routes	Must	5
5	As a user, I would like to be able to visualise routes on the map so that I can understand them better.	Should	8
6	As an admin, I want to add new routes with new respective indicator values.	Should	5
7	As a traveller I want to select edges to create a new route to complete a mission	Could	5
8	As a user I would like to log into an admin/traveller account securely	Could	2-3
9	As a traveler, I want to estimate real crime data from the indicator values shown on the route.	Will not have	

Exploring technologies for the interface/web app (In order of interest): Godot, Flask, Javascript, Java

Engine ideas, Frontend/backend, SQL (PostgreSQL?)

OpenStreetMap for dataset

Ideas for codebase:

Javascript frontend - Leaflet api for interactive maps

Python backend - FastAPI

Accounts with Python + SQLite/PostgreSQL

Tasks for each Story

1.

User selects nodes

Dataset

Route-finding algorithm (Filter for preferred edges beforehand/Algorithm takes into account preferences)

Feedback/Visualisation

2.

Admin Interface (maybe a toggle for the demonstration)

Create Change Log

Update database with changes after admin actions

3.

Backend handling database queries

Front end that takes user input

4.

At least 18 missions across three tiers (6 per tier)

Users earn points/badges and can track progress

5.

Create a map like UI

Routes must have indicator weightings on hover over an element

Analytics views

6.

Dataset

Route-finding algorithm

Admin interface (and way to update DB using interface)

Database

7.

Visualise route selected (pre-requisite?)

Data-set

Way to select edges in UI/visualisation

8. Ability for the user to obtain edges from the map by interacting with the system.

Ability to implement new routes into the system from user-selected edges.

Ability to take on missions and use user-defined routes to complete missions

Mission criteria

Mission start/end

Deciding Indicators

In order of importance

1. Distance/Time

Have some basic working parts by Monday (26th) or 2nd Meeting next week
Ask about what is meant by “Deployed URL” -> Local or Online?

New Ideas:

- Named location has a type associated with it to search by

Other notes:

Javascript frameworks:

- Express for handling requests and backend
- Leaflet for handling map

Rebuild graph of nodes and edges before sending to frontend to be displayed on map

30/01/26

Catch up meeting

Scrum master - Ed

In this scrum we discussed what each person has been doing.

New tasks-

Node data will be implemented on the map

Work on linking files and user validation

02/02/2026

Walkers struggle with finding safe and efficient routes in urban areas, causing unnecessary exposure to risk.

We aim to provide users with a choice of routes so that walkers can choose the route that works best for them, measured by a number of route indicators.

We built a map app that provides these routes. Evidence:

Presentation Structure:

- Problem + users
- Approach + design
- Implementation
- Evaluation
- Demo
- Limitations + next steps

Slide	Title	1 Key Message	Evidence	Speaker	Time
1	Our Problem				
2	Our Design				
3	Implementation				
4	Evaluation				
5	Demo				
6	The future				

Implementation Notes:

Starting to bring parts together

Pivoting to flask for better internal communication

05/02/2026

In this scrum we discussed the structure of the report and further documentation. We agreed that everyone would supply written information and screenshots regarding how their code is designed to contribute to the main bulk of the report. In the next couple of days, the requirements and design section of the report will be written in full.

Further progress has been made on the backend, where Flask can be used to bring up some of the screens such as the interactive map.

Efforts are being made to connect components such as the dataset, database and routefinding algorithm.

Only one mission is required for the first sprint, so we will ensure we deliver this.

The five indicators we will use to calculate the route score will be...

- Distance
- Elevation
- Lighting
- Greenery
- Crime

Testing Checklist:

- Routefinding algorithm
- Handling GET requests
- Handling POST requests
- Database and error handling

We need to finish Admin view.

Questions for Monday:

- Deployed URL?/ Servers -> Sprint 2

11/02/2026

Assigned scrum tasks using scrum board. Moving towards final version of prototype.
Building up documentation, testing and presentation.
